

LEARN MORE

HOW TO APPLY HONEYCURE

Step 1

Clean the wound with warm water or saline solution, and pat dry.

Step 2

Apply a thin layer of HoneyCure to the wound and surrounding area.

Step 3

Every 6-12 hours, reapply HoneyCure and redress the wound.

You should be able to see improvement within three days.

How to Remove HoneyCure:

To remove HoneyCure, rinse the wound with warm water. This will soften the ointment. Do not pull at the ointment or scratch it off.

For serious wounds, seek a veterinary professional as soon as possible.

WHAT IS HONEYCURE?

HoneyCure is a natural veterinary care product that helps with wounds such as burns, scrapes, cuts, bites, and hot spots.

Created by EnBiologics, Inc. in 2016, our ointment is made with UMF 15+ Manuka honey which helps to provide a stable environment for rapid wound healing.

HoneyCure is suitable for:

Dogs

Cats

Horses

Other Animals*

**Please consult a veterinarian before using on an amphibian, bird, or reptile.*

WHY WE USE UMF 15+ MANUKA HONEY

Honey has been known to assist with healing for thousands of years!

The main active ingredient in HoneyCure is UMF 15+ Manuka honey. UMF stands for Unique Manuka Factor and is a special certification by the Unique Mānuka Factor Honey Association to determine the quality of New Zealand Manuka honeys. Manuka honey with a UMF rating of 10 or higher is medical grade.

In HoneyCure, Manuka honey helps to create an inhospitable environment for bacteria to grow. The honey also works with the tea tree essential oil to soothe the wound and discourage your pet from licking because of its unappealing taste and smell.

ABOUT WET WOUND HEALING

We suggest wet wound healing when caring for your pet's wounds!

This is the practice of keeping a wound moist as it heals. Cells prefer a wet environment to heal because it helps diffuse nutrients and oxygen throughout the body. Keeping a wound moist prevents inflammation and encourages skin growth with minimal scarring.

Dry wound healing is when a wound is left open and clean so that a scab can form over. The scab acts as a barrier to the environment and allows the tissue to slowly regrow. This can be itchy for your pet and lead to scar formation.

Manuka honey is only made from the Manuka bush in New Zealand.

HoneyCure uses the practice of wet wound healing to encourage a better healing process.

ELLIE'S STORY

“

My dog, Ellie, was run over in our driveway. I applied HoneyCure to her skin twice a day; it is 100% back to normal now. I LOVE this product and thank you guys so much for creating it. I'm super happy with the results. If I need anything to work for any skin problems my animals may have, I'll go to HoneyCure first thing.
